

ROOF LIGHTS

Roof lights are used for the interior lighting of vehicles and come in recessed or surface-mounted configurations.

Ideal for insulated vans, as they withstand normal wash-down duty without damage to internal wiring connections.

Use standard care and caution and follow these warnings:

- Use type-approved cables with adequate cross-section area.
- Ensure that roof light rating matches the realized system.
- For all types of lights: never use bulbs exceeding the rating indicated on the item, as they would generate a greater amount of heat which might damage lens, connections or the whole system.
